

# Enterprise Cloud

from NTT Communications

# Helping you expand your business, globally

NTT Communications Enterprise Cloud solution is designed to specifically meet your unique needs no matter the structure of your enterprise. We understand that not everyone is at the same point on their migration to the cloud and business objectives vary from one organisation to another. That is why our solutions and services have been packaged to create a functional and successful cloud for your business – a real-world, enterprise cloud.

## **SIMPLICITY**

The NTT Communications Enterprise Cloud is your seamless cloud for the real world: One portal. One contract. One SLA.

## **GLOBAL ICT PARTNER**

Our new Infrastructure as a Service (IaaS) offering is a global, virtualized data center in nine locations (across Asia-Pac, Europe and the US) and is the world's first cloud to use software defined networking, giving you the power to manage your traffic in a flexible and more efficient way.

To an enterprise, cloud is more than just virtualized hosting. Enterprise Cloud is the real-world cloud. It provides global cloud resources that enterprise customers can easily control and manage to optimise ICT costs and to support global expansion of corporate operations.

Enterprises need security, legacy environment integration, SLAs, predictable spend and estate management - one user and one password doesn't work for big companies. Enterprise Cloud allows departments to maintain policies while providing the required flexibility. Each data center is connected to the NTT Communications highly resilient and reliable global network, and integrated with software defined networking (SDN), enabling customers to connect to and use that network securely.

## **FLEXIBILITY**

Some applications and infrastructures need to stay where they are - they are not suitable for cloud. Enterprise Cloud gives you the flexibility to connect your existing IT estates securely, using private, secure interconnect gateways between the data centers and other local and remote services. This means you can manage the applications and infrastructures that are in the cloud, alongside those that aren't.

# Your needs are unique and so is your cloud

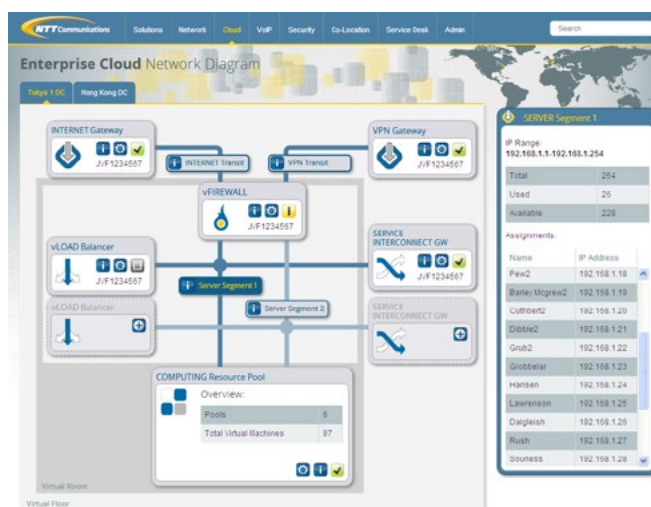

Built on a foundation of advisory, migration, operational and management services, we offer a new infrastructure as a Service (IaaS) that allows us to deliver high-quality and comprehensive enterprise solutions.

## SECURE CONTROL

Enterprise Cloud offers security, compliance and high quality performance to support critical enterprise applications. To ensure business continuity, we offer flexible options for backup and disaster recovery over SDN using our global and secure virtualized networks.

The Customer Portal allows you to manage your global IT estate from one place, with the freedom to deploy and manage your virtual infrastructure anywhere in the world. Colocation, managed hosting, cloud services and service tickets can all be managed from the portal. Deploy new applications and servers or allocate resources in a way that suits you.

This single portal provides a simple tool for integrating ICT systems that are spread across locations.

Through the Customer Portal, customers can:

- Manage their global services and assets database
- Get a complete view of all service related information and the status of the network
- Administer all virtual sites and create resource pools with individual or group user access, with visibility of roles and responsibilities
- Pull reports to show historic and performance data, backup usage, bandwidth statistics
- Customise the portal dashboard
- Create new support tickets and track incidents in real-time

## COST OPTIMIZATION

We view cloud as an innovative business model, rather than as just new technology. Optimize your costs through minimal resource contracts and pay-per-minute billing, all of which can be managed through the single portal. Benefits include possible reductions in capital expenditure, maximizing energy efficiency through better IT distribution with the customer portal and it helps free IT resources previously allocated to infrastructure, helping you to focus more on your core business.
