

Network Traffic Analyzer

from NTT Communications

Full visibility with detailed analysis of your live NTT network usage

As a network professional, it's important to know exactly what is happening within your network. You need to know who is using your network applications or services. NTT's Network Traffic Analyzer (NTA) service allows you to obtain live views of the traffic on your network instantly.

NTA uses flow based export capabilities inherent in most of today's routers to generate a number of unique data view sets of your network traffic. The data is used to store information on all network sessions flowing through the network over an extended period of time. With this information our systems can present valuable network usage reports which can be accessed via the NTT customer portal.

NTA will enable you to monitor which applications are consuming the bandwidth over your network, you can see the source or destination of each any every traffic flow and be provided with a comprehensive and detailed analysis of your live network usage.

The NTA service can report on usage across a network based on the IP address, Application (port), Subnet, AS number and Type Of Service (TOS) of each individual traffic flow.

BENEFITS OF NTT's Network Traffic Analyzer

Investigate your network

Detailed reports showing each traffic flow across your network

Application Performance

Find out who is accessing an application at any given time and how much bandwidth they are consuming

Network Performance

Get real-time insight into your network performance with one minute granularity reports. Rapidly identify the root of the cause of any congestion inside the network.

Live reports at your finger tips 24/7

Real time traffic analysis displayed in your customer portal, available to see any time of day.

Resolve your IT challenges with a complete monitoring solution

Application slowdowns, bottlenecks and response time issues are amongst the most challenging issues for network managers to deal with. Resolve and prevent them from happening again with NTT's Network Traffic Analyzer.

KEY FEATURES

Our monitoring solution is based on these fundamentals:

- **Remote monitoring** - No expensive hardware needed, data is polled from existing customer hardware
- **Multi-Vendor-Availability** - Most Cisco or Juniper routers can be used for network monitoring and with NTA no additional (costly) hardware probes are required
- **Complete Visibility** - NTA is practically alone in being able to report on every data conversation. The conversations that matter today start and remain small - virus, voice, peer-to-peer, hacking and worms. Only complete visibility makes tracking these conversations possible
- **Detailed Analysis** - The ability to examine network traffic down to the packet level allows us to provide a broad spectrum of detailed reports. Every IP address from network traffic coming into the network will be tracked as well as every destination IP address being accessed outside of the network
- **Web based (via Customer portal)** - The NTA service is available to all of NTT's existing network customer via their dedicated online customer portal

SOLVE PERFORMANCE PROBLEMS FASTER

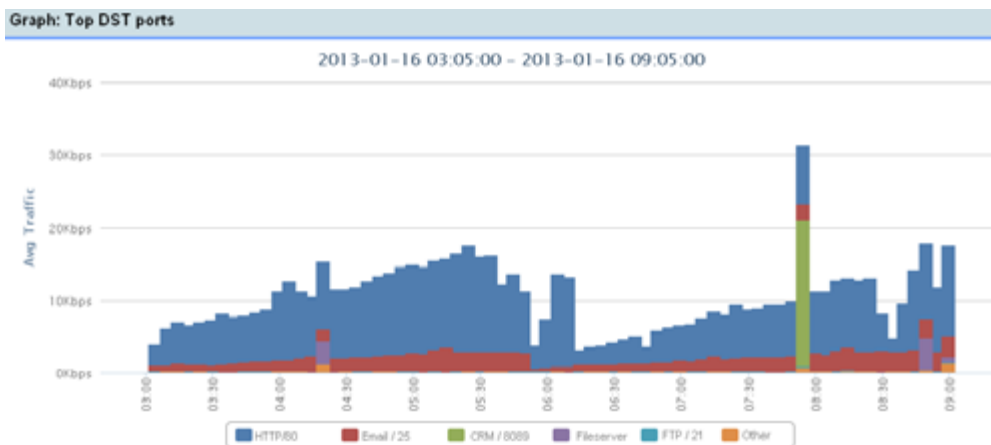

Visualize where your network traffic is coming from and where it is going to, identify bottlenecks, congestion and view applications, hosts and conversations consuming WAN bandwidth to isolate and resolve problems.

MONITOR YOUR LAN

- Enforce security policies
- Identify suspicious behaviour
- Quickly respond to security threats
- Account for network usage
- Reduce network costs

FREE DEMONSTRATION

Contact us now to organise a full demonstration of NTT's Network Traffic Analyzer.
